Help us share our service with your friends. A donor atom has five electrons in its outermost valence shell, while an acceptor atom has only 3 electrons in the valence shell. GE typically has a working limit of about 85 degrees Celsius, while the SI can be used at temperatures approaching 200 degrees Celsius. 12. 10. For permission (s) to use the material in this work, please send a written request to Pearson Education, Inc., Permit Department, 1 Lake Street, Upper Saddle River, New Jersey 07458. 15. 2. An N and N. Semiconductor-type material has an excess of electrons for conduction established by doping an intrinsic material with donor atoms with more valence electrons than is necessary to establish the covalent bond. The application of an external electric field of the correct polarity can easily draw this poorly connected electron from its atomic structure for conduction. 3. Giulium phosphide zinc sulphide EG = 2,24 EV EG = 3,67 eV A semiconductor material of the P type is formed by donating an intrinsic material with acceptor atoms of a number of Eleras in the ValÃªcancia shell to complete the ligaÃ§Ã £ o Covalente, raising a hole in the covalent structure. â,¬ 4. GAP ZNS ZNS Intrinsic material: an intrinsic semiconductor is one that has been refined to be as pure as physically possible.
